MILK PRODUCTION ON FARMS AND
STATISTICS OF DAIRY PLANT PRODUCTS, 1956

SUMMARY

Milk production on United States farms in 1956 reached an alltime high of 125.7 billion pounds, according to revised estimates. This exceeds the previous record for 1955 by more than 2.5 billion pounds. Annual production per cow averaged 6,006 pounds -- above the 6,000 mark for the first time on record and nearly one-fourth higher than a decade earlier. Numbers of milk cows on farms continued to decline, totaling 20,927,000 for 1956, the smallest annual number in records dating back through 1924. Numbers of heifers and heifer calves on farms January 1, 1957, for replacing milk cows were down from a year earlier and the smallest since the late 1940's. The Nation's farm milk output was sufficient to provide 748 pounds per person in 1956, the lowest of record except for 1955.

Creamery butter production for 1956 was 2 percent higher than for the preceding year. The total output of cheese was at a record high and 2 percent above 1955. American cheese production during 1956 was the third highest of record but the production of many of the other types of cheeses were at record high levels. Ice cream output in 1956 was the second highest of record, while ice milk and Mellorine-type frozen desserts were at record high levels. The 1956 output of evaporated whole milk was the second lowest since 1940. Canned condensed whole milk production was the highest since 1949 but it was far below the record high. Dry whole milk output was at the highest level since 1951. Combined production of nonfat dry milk for human consumption was the highest of record. The selling price of nonfat dry milk by manufacturers averaged slightly lower in 1956 than in 1955. Prices paid by dairy plants for milk for manufacturing purposes in 1956 averaged \$3.28 per hundredweight, up 10 cents from 1955 but down 31 cents from the 1950-54 average.

The dealers' weighted buying price f.o.b. city for Class I milk of 3.5 percent milkfat in 1956 was \$.34 per hundredweight. This was 15 cents per hundredweight above 1955 but the same as the 1950-54 average. Retail prices per single quart of standard grade milk delivered to homes in 25 major cities during 1956 averaged 24 cents per quart - a 37-year record high--exceeding the 1955 average by 1 cent and the 1952 previous high by 0.8 cent. Average daily sales of whole milk during 1956 in 31 Federal Order markets with data on in-area sales available were 2.2 percent above 1955. Sales of skim milk products during 1956 were 2.7 percent above the previous year. Half and half sales showed the sharpest increase of any fluid product - 9 percent above 1955 as compared with a 3.6 percent decrease in fluid cream sales. Average daily receipts of milk from producers in 53 Federal Order markets were 4.2 percent above 1955. Producer numbers declined 4.3 percent during 1956; however, daily receipts per producer increased 9.1 percent from 1955.

MILK PRODUCTION ON FARMS, 1956

Milk cows on farms in the United States produced a total of 125,698 million pounds of milk in 1956 - a new high annual output. Estimates just released for the 48 individual States placed production at 2,570 million pounds above the revised total of 123,128 million pounds of milk for 1955. Annual milk production during the years 1946-55 averaged more than 117 billion pounds, with total output ranging from 113 billion pounds in 1948 to 122 billion in 1954. The large milk output in 1956 was the result of record high milk production per cow, since the number of milk cows declined from the previous year and was below average. Production per capita, at 748 pounds in 1956, was more than in 1955 but less than the preceding 2 years and was about 7 percent lower than the 1925-39 average.

Milk production in 1956 exceeded the output of the previous year in 35 States. Production was higher than in 1955 in all regions except the West, which nearly equaled the 1955 output. The largest gains occurred in the West North Central States and in the southeastern section of the country. Increases of 4 percent or more were recorded in Minnesota, Iowa, Georgia, Florida, Kentucky, Tennessee, and Utah. Milk production decreased 2 percent or more from 1955 in Rhode Island, New Jersey, Indiana, Kansas, Colorado, and Oregon. Wisconsin was the leading State in total milk production in 1956 with 16.9 billion pounds of milk, followed by New York with 9.9 billion pounds, and Minnesota with 9.4 billion.

Production heavy in fall and winter months of 1956

Milk production in 1956 continued heavier than average during the fall and winter months. Output from January through April set new highs for each month, exceeding production in 1955 by 2 to 9 percent and the 10-year average by 8 to 17 percent. Production in May and June was at about the same level as in 1955, but was 4 and 2 percent above the May and June averages. July production continued the seasonal decline started in June, and was 1 percent above the same month of 1955 and average. Output in August 1956 was 2 percent above the previous year and average. Production set new record highs for the months September through December 1956, and was 1 percent above a year earlier in each of these months. Production was 4 percent above average in September, with the relationship increasing monthly until reaching 12 percent above average in December 1956. The practice of increased late summer and fall freshening of milk cows and the continued heavy feeding of grain and concentrates in the off-season months contributed to the record milk flow in the usual low production months.

Milk per cow reaches new high

Annual production per cow set a new high average of 6,006 pounds of milk, or 231 pounds of milkfat, in 1956. Output per milk cow has gained steadily each year since 1944, and has increased 23 percent in the last decade. The greatly increased rate per milk cow has been encouraged by heavier feeding of concentrates, higher producing milk cows from the use of good bulls in

the artificial breeding program, and improved management practices accomplished in part by concentrating cows in fewer and larger milking herds. Production rate per milk cow was at a record high in most States in 1956, with gains indicated for all the major milk producing States. Generally, the heaviest increases from the year earlier were in the north central and southeastern parts of the Nation. California, with 8,600 pounds, led all States in milk production per cow, followed by New Jersey with 7,850 pounds. Louisiana and Mississippi, with 2,800 and 3,000 pounds, respectively, had the lowest rates per milk cow in the country.

Further decline in milk cows

The number of milk cows on farms in the United States in 1956 totaled 20,927 thousand head, down more than 1 percent from the 21,193 thousand on farms in 1955, and was the smallest number on records dating back through 1924. Numbers decreased sharply from the record high of 25.6 million head in 1944 to 22.3 million in 1948, and ranged from 22 to 21 million until 1956. The number of milk cows on farms has edged down slightly each of the past 3 years. The number of milk cows on farms in 1956 declined from 1955 in 37 States. Numbers equaled or exceeded the previous year in only Maine, New Hampshire, Vermont, Pennsylvania, Wisconsin, Minnesota, Florida, Kentucky, Utah, Nevada, and California. Wisconsin ranked first with 2,302 thousand milk cows on farms, followed by Minnesota with 1,387 thousand, and New York with 1,365 thousand.

Milk cattle for breeding and replacement down slightly

Cows and heifers 2 years old and over kept for milk on farms January 1, 1957, totaled 23,028 thousand head, a decline of 1 percent from a year earlier and the smallest number in 28 years. Decreases from a year earlier were rather general in central and south central areas, and were 3 percent or more in Indiana, Missouri, Oklahoma, Alabama, Texas, and some minor milk producing States. On the other hand, Minnesota, Wisconsin, Pennsylvania, Nebraska, Utah, Idaho, and Arizona farmers had more cows and heifers for milk than on January 1, 1956. In Ohio, Iowa, and California, numbers were unchanged, and in New York and Illinois were down 2 percent.

Number of young stock for replacing milk cows also continued to decline. Heifers 1 to 2 years of age kept for milk cows on January 1, 1957, numbered 5,392 thousand head, down 3 percent from the preceding year. The number of heifers per 100 milk cows was 23.4, the smallest in 6 years. Heifer calves under 1 year kept for milk cows on January 1, 1957, totaled 6,039 thousand, slightly below the 6,044 thousand a year earlier and the smallest number since 1948. The number of heifer calves per 100 cows, at 26.2, was somewhat higher than in the previous 2 years, but lower than in the 1951-54 period.

1/ Preliminary.

PRODUCTION, STOCKS, AND PRICES OF MANUFACTURED DAIRY PRODUCTS, 1956

Production of Swiss, Brick and Munster, Italian, and Cream cheeses, Mellorine-type frozen desserts, and spray-dried nonfat milk reached record high levels in the United States during 1956, the Agricultural Marketing Service reports. However, Limburger cheese output was at the lowest level in 39 years of record. Gains from 1955 for major products were registered in the production of butter, total cheese, ice cream, canned condensed whole milk, and total nonfat dry milk. Evaporated whole milk output in 1956 was below a year earlier.

Creamery butter production for 1956 totaled 1.41 billion pounds, up 2 percent from the previous year and 6 percent from the 1950-54 average. Production in only two regions, the East North Central and West North Central, were above a year earlier but these gains were significant since the two regions produced 83 percent of the national output in 1956. The three leading States in order of importance of production were Minnesota, Wisconsin, and Iowa, which together produced 53 percent of the total creamery butter in 1956 compared with 49 percent for the preceding year. By regions, production changes from 1955 to 1956 ranged from a gain of 6 percent in the West North Central region to a decline of 24 percent in the Pacific region.

Total cheese production for 1956 equaled 1.39 billion pounds, a new high record, an increase of 2 percent from the previous year and 11 percent from the 1950-54 average. Output was above a year earlier for each month of the year except May and June. The range for the year was a decrease of 6 percent in May to an increase of 7 percent in October.

American cheese output during 1956, at 1.01 billion pounds, was the third highest of record, a fraction of a percent above the preceding year and 8 percent above the average. Increases from the preceding year, by regions, were as follows: South Central, 10 percent; West North Central, 3 percent; Mountain, 2 percent; and North Atlantic, 1 percent. Declines were as follows: South Atlantic, 23 percent; Pacific, 11 percent; and East North Central, 2 percent. Wisconsin's production continues to rank first among the States, representing 45 percent of the national total in 1956 compared with 46 percent for 1955.

Swiss cheese production for 1956 was at a record high of 120,740,000 pounds, up 3 percent from the previous record in 1955 and 17 percent from the average. The combined output of Brick and Munster cheese, totaling 49,050,000 pounds, was also the highest of record. Production was 14 percent and 41 percent, respectively, higher than a year earlier and the 1950-54 average. Limburger cheese production equaled 4,720,000 pounds in 1956, the lowest of record, 5 percent and 20 percent, respectively, less than a year earlier and the average. The record production of Limburger cheese was 11,982,000 pounds in 1936. Cream cheese output in 1956 totaled 79,100,000 pounds, the highest of record, an increase of 6 percent from the previous year and 13 percent from the 5-year average. Production of Neufchatel cheese, at 9,700,000 pounds, was 69 percent above the preceding year and 77 percent above average. Italian cheese equaled 93,020,000 pounds, the highest of record, an increase of 9 percent from 1955 and 46 percent from the average. The output of Blue Mold cheese, at 10,000,000 pounds, was fractionally below a year earlier, but 16 percent above the average. Unclassified varieties of cheese equaled 20,500,000 pounds during 1956, down fractionally from the previous year and 8 percent from the average.

Production of frozen dairy products, with the exception of milk sherbet, was higher in 1956 than in the preceding year. Ice cream production for 1956 was estimated at 650,985,000 gallons, second highest of record and 4 percent higher than the 1955 output. The all-time high record was made in 1946 when 713,769,000 gallons were produced. All regions showed gains from 1955. The increases ranged from 1 percent in the West North Central to 6 percent in the South Central and Pacific regions.

Estimates of ice milk production, now available, show that in 1956 ice milk reached another new all-time high record. At 96,949,000 gallons, production registered a gain of 9 percent over 1955. Production of ice milk has gained each successive year since 1944 when it totaled 8,350,000 gallons. Production of helorine-type frozen desserts (made with fats and oils other than milkfat), at 33,345,000 gallons for 1956, showed a gain of only 1 percent from the preceding year. Milk sherbet production at 36,050,000 gallons for 1956 was down 3 percent from the preceding year. This is the first year since 1947 that milk sherbet failed to register a gain over the preceding year.

Evaporated whole milk production for 1956 totaled 2.54 billion pounds, a decline of 2 percent from 1955 and down 7 percent from the 5-year average. This production was the second lowest since 1940, the lowest being in 1954 when 2.53 billion pounds were produced. Comparing production of evaporated milk by months for 1956 with that of the preceding year, the output was either unchanged or lower during the first 6 months of the year and higher or unchanged during the last 6 months. Changes ranged from a decline of 9 percent in March to a gain of 4 percent in July. Canned condensed whole milk production in 1956, at 64,390,000 pounds, was the highest since 1949, up 91 percent from a year earlier and 33 percent from the 5-year average. All months of the year registered gains over the same months a year earlier, ranging from 18 percent in March to 206 percent in May.

Manufacturers' stocks of evaporated whole milk at the end of each month during 1956 showed considerable variation from the same dates a year earlier. In the early and late months of the year, stocks were in general higher than those for the corresponding dates a year earlier. During the months from April through October, however, stocks were lower. Changes from the same date a year earlier ranged from 13 percent higher on November 30 to 36 percent lower on May 31. Stocks of canned condensed whole milk were higher in every month of the year than on the corresponding dates in 1955. Gains ranged from 14 percent at the end of August to 109 percent at the end of March.

Manufacturers' selling prices of evaporated whole milk averaged \$5.83 per case of 48 14 $\frac{1}{2}$ -ounce cans in 1956. This represents a gain of 24 cents from 1955. All months registered gains over the same month a year earlier. The gains ranged from 11 cents in March to 36 cents in August, September, and October.

The 1956 production of total nonfat dry milk products reached a record high of 1.48 billion pounds. This compares with the previous record in 1955 of 1.41 billion pounds and the 1950-54 average of 1.01 billion pounds. Changes in production from a year earlier by months ranged from an increase of 18 percent in February to a decline of 5 percent in May. Each month's production was above the 5-year average for that month and ranged from 73 percent higher in February to 26 percent higher in August. Spray-dried nonfat milk production for 1956, at a record 1.31 billion pounds, was 8 percent above 1955, the previous record, and

65 percent above the average. Roller-dried nonfat milk output during 1956 equaled 173,100,000 pounds, down 12 percent from a year earlier and 21 percent from the 1950-54 average.

Dry whole milk production during 1956 totaled 107,525,000 pounds, the highest since 1951, 1 percent above the preceding year but 3 percent below the average. At 94,950,000 pounds, the output of spray-dried whole milk was down 2 percent from 1955 and 7 percent from the 1950-54 average. Roller-dried whole milk production equaled 12,575,000 pounds during 1956, an increase of 22 percent and 35 percent, respectively, from the previous year and the average.

Production of dry skim milk for animal feed during 1956 totaled 16,450,000 pounds, a decline of 4 percent from the preceding year and 14 percent from the average. Dry buttermilk output for 1956 was 62,600,000 pounds -- highest since 1942 -- up 7 percent from the previous year and 23 percent from the 1950-54 average. Production was above each month a year earlier, except for May, November, and December.

Manufacturers' stocks of total nonfat dry milk varied by months from 46 percent more than a year earlier in January to 17 percent less in November. On December 31, 1956, stocks totaled 69,368,000 pounds, 14 percent below a year earlier but 9 percent above the 5-year average. Stocks of dry whole milk reported by manufacturers at the end of each month during 1956 were above those of a year earlier. The increases varied from 33 percent at the end of February to 7 percent for November. On December 31, 1956, stocks totaled 10,757,000 pounds, 25 percent higher than a year earlier but 13 percent lower than the average. Dry buttermilk stocks were above a year earlier at the end of each month, except December. They equaled 4,184,000 pounds on December 31, 1956, a decline of 2 percent from a year earlier and 40 percent from the average.

Manufacturers' selling prices of total nonfat dry milk during 1956 averaged 15.24 cents per pound, a decline of one-tenth cent from the preceding year. Prices of spray-dried nonfat milk averaged 15.51 cents per pound compared with 15.57 cents for 1955. February, March, April, and May prices were higher than a year earlier but all other months were lower. Roller-dried nonfat milk averaged 13.46 cents per pound during 1956, one-half cent below the previous year. The average for each month was lower than the same month in 1955.

Selling prices of dry skim milk for animal feed in 1956 averaged 9.96 cents per pound, four-tenths cent less than the preceding year. Combining both human food and animal feed, the price of dry buttermilk averaged 12.82 cents per pound during 1956, one-fourth cent more than the previous year.

Sales of dry whole milk by manufacturers for all sizes of packages averaged 38.38 cents per pound, down one-fourth cent from 1955. In 1-2½ pound packages, prices averaged 43.76 cents per pound during 1956, up six-tenths cent from the preceding year. Prices of 5 pound packages averaged 39.13 cents per pound, one-third cent above 1955. In miscellaneous large packages, mostly barrels and drums, prices averaged 32.54 cents per pound in 1956, one-third cent below the previous year.

The 1956 annual average price paid by dairy plants for all manufacturing milk was \$3.28 per hundredweight, up 10 cents from 1955 but down 31 cents from the 1950-54 average. Prices were higher in all months of 1956 and ranged from 3 cents per hundredweight in January and February to 15 cents in May, June, and July. The price series for manufacturing milk is developed by weighting the prices paid for milk used in the production of butter and byproducts, American cheese, and evaporated milk. The individual series from which this manufacturing milk price is developed are shown in table 10.

Prices per hundredweight paid farmers for milk used for butter and byproducts, f.o.b. plant, for 1956 were above a year earlier for all months. The increases ranged from 1 cent in January and February to 15 cents in November. The price per pound of milkfat varied from 84 cents for the first 5 months of 1956 to 88 cents in November. The average price per hundredweight paid for milk used in American cheese in 1956 was above a year earlier for all months. The advances ranged from 4 cents for March to 17 cents in May, June, and July. The price per pound of milkfat varied from 82 cents in March to 85 cents in December. Average price per hundredweight paid for milk used for evaporated milk in 1956 was above a year earlier for all months. The increases ranged from 3 cents in March to 15 cents for May, June, and September. The price per pound of milkfat varied from 82 cents for May, July, and August to 87 cents in December.

1/These data do not include receipts at all warehouses. Wisconsin receipts represent practically all warehouses, while receipts in the remainder of the Country represent only the major assemblers.
 2/Dates shown are for 1956. The comparable weeks of 1955 ended one day later through February 25 and two days later for the weeks thereafter.

Conversion of the Average Milk Dealers' Buying Price for Class I Milk to a Weighted F.O.B. City Basis

The revised series begins with 1935 and includes f.o.b. city prices for all the 156 markets except New York, Chicago, and New Orleans. The prices for the Chicago and New Orleans markets are on a 55-70 mile zone and 61-70 mile zone basis, respectively. For New York City, an f.o.b. city price has been calculated by an adjustment of the basic price at country points through information supplied by the trade.

In establishing a weighted price series, the principal problem was to determine a weight for each market in the absence of data indicating the pounds of Class I milk purchased from producers. Estimated populations of the marketing areas were used as a substitute. Populations of the marketing areas were aggregated by minor civil divisions as shown in the censuses of 1930, 1940, and 1950. Yearly differences were estimated by simple linear interpolation for the intercensal years from 1930 to 1950 and by extrapolation for the years 1951 to the present.

The weighted average price series shows about the same behavior as the unweighted series but at a higher level, with certain exceptions caused by the simultaneous increase or decrease in Class I prices in the very large markets. The great weight of the very large markets causes the weighted average price to fluctuate over a wider range than the unweighted series.

FLUID MILK AND CREAM MARKET STATISTICS

For the first time in this report, the dealers' average buying prices for Class I milk as shown in tables 27 and 28 are on an f.o.b. city basis weighted by market area populations. The new series reflects changes in milk marketing practices which have occurred since the series was initiated. Prior to this change, the average price was a straight average of calculated country point prices as reported each month, and represented a combination of prices at both country points and city plants in the later years. (See page 35 for discussion of weighting methods.)

Class I prices advanced in 1956

The milk dealers' weighted average buying price for Class I milk during 1956 in 156 markets was \$5.34 per hundredweight. This was 15 cents per hundredweight above 1955 and the fifth highest average of record. The 1956 figure was at about the same level as the 5-year (1950-54) average. By months, the Class I price in 1956 was above a year earlier except in March when it was 1 cent below March 1955 and in April when it equaled the April 1955 price. In the other months, increases ranged up as much as 27 cents per hundredweight above a year earlier in both June and July. Seasonally, the average Class I buying price in 1956 ranged from \$5.01 per hundredweight in April to \$5.63 in November, a 62-cent difference which is about the usual variation in recent years between the high and low months.

By regions 1956 Class I prices ranged from \$4.46 per hundredweight in both the East and West North Central regions to \$6.24 per hundredweight in the South Atlantic States. In other regions, annual Class I price averages were: New England, \$5.93 per hundredweight; Middle Atlantic, \$5.84; West South Central, \$5.78; Mountain, \$5.68; and in the Pacific region, \$5.05 per hundredweight. In 8 of the 9 regions, dealers' Class I prices in 1956 averaged higher than in 1955. The increases ranged from 3 cents per hundredweight in the Middle Atlantic States to 33 cents per hundredweight in the East North Central region. The only region failing to show an increase in 1956 was the New England area where prices averaged the same as in 1955. By regions, the seasonal variation of Class I prices ranged from 19 cents per hundredweight in the Mountain States to \$1.46 per hundredweight in the New England area.

Home delivered prices increased sharply in 1956

The average retail price of standard grade milk delivered to homes in 25 major cities during 1956 was 24 cents per quart - the highest in 37 years of record, exceeding the 1952 previous high by 0.8 cent. The 1956 average was 1 cent per quart higher than 1955 and 1.9 cents higher than the 5-year (1950-54) average. In the first 3 months, the average was 0.4 cent per quart higher than in 1955 and increased steadily until August when the difference was 1.5 cents per quart. In the last 3 months of 1956, the average was 1.1 cents per quart higher than in 1955.

By markets, the average annual price in 1956 was higher than 1955 in all markets with the exception of Jacksonville, Fla., which was unchanged, and New Orleans, La., which showed a decrease of 0.3 cent per quart.

Seasonally, prices of home-delivered milk in December 1956 were higher than January 1956 in all markets except Kansas City, Missouri, Jacksonville, Fla., and New Orleans, La., which were at the same level. Increases from January to December ranged from 1 cent per quart in 9 markets to $2\frac{1}{2}$ cents per quart in 2 markets, Boston, Mass. and Detroit, Mich. In New York City, N. Y., Milwaukee, Wis., Louisville, Ky., Dallas, Texas, and Salt Lake City, Utah, the increase was 2 cents per quart. Five markets showed an increase of $1\frac{1}{2}$ cents per quart -- Pittsburgh, Minneapolis, Seattle, San Francisco, and Los Angeles. Hartford, Conn. reported a $\frac{1}{2}$ -cent per quart increase.

Sales of whole and skim milk products show increase

Average daily sales of fluid whole milk during 1956 in 31 Federal Order markets with data on in-area sales available were 2.2 percent above 1955. This compares with an increase of 4.4 percent for a similar group of markets in 1955 over 1954. In the first 6 months of 1956 whole milk sales showed substantial increases over 1955 but sales in July, August, and September barely exceeded the level of a year earlier. In October and November whole milk sales were again well above the comparable months a year earlier but declined to the 1955 level in December. All 31 markets showed increased sales of whole milk during 1956 with increases ranging from 1 to 8 percent.

Average daily sales of skim milk items during 1956 in the 28 Federal Order markets were 2.7 percent above the previous year. This represents a sharp decline from the rate of increase shown in 1955 when sales of skim milk products for a similar group of markets exceeded 1954 by over 10 percent. The seasonal pattern of skim sales during 1956 generally followed the same pattern shown by the whole milk sales. By markets, sales of skim products in 1956 as compared with 1955 were somewhat more varied than sales of whole milk. Five markets showed decreases from a year earlier ranging from 1 to 6 percent. In 2 markets, skim sales were practically unchanged from the previous year. However, in the other 21 markets, sales of skim products in 1956 increased over a year earlier with 9 markets reporting increases of 10 percent or more.

Sales of milk and cream mixtures substantially higher, fluid cream lower

Average daily sales of milkfat in milk-and-cream mixtures (commonly known as half-and-half) during 1956 in 25 Federal Order markets (Massachusetts and New York City markets excluded) were 9 percent higher than in 1955. This continues the sharp upturn in half-and-half sales shown in 1955, when sales were 14 percent above the previous year. Of the 25 markets with data on half-and-half sales available on an in-area basis in 1956, 20 showed increases. In three markets half-and-half sales decreased from 1 to 6 percent and were unchanged from a year ago in 2 markets. Several markets with higher sales in 1956 showed marked increases ranging up as high as 51 percent in the Philadelphia, Pa. market.

Average daily sales of milkfat in fluid cream products during 1956 in 26 Federal Order markets (Boston, Merrimack Valley, Springfield, and Worcester, Mass. and New York City excluded) decreased 3.6 percent from 1955. This is about the same rate of decrease as shown in 1955. Sales of fluid cream in 1956 were below 1955 in 20 of the 27 markets with decreases ranging from 1 to 14 percent.

1/ See footnote 1/ on opposite page.

2/ Includes products such as milk and cream mixtures and egg nog, with milkfat content higher than whole milk and lower than the minimum for fluid cream.

3/ Includes sweet, sour, and aerated cream meeting minimum milkfat standards. 4/ Revised.

5/ Preliminary. 6/ Computed from unrounded figures.

7/ Skim items and mixtures included with whole milk; percentage change for whole milk based on comparable figure for 1955. 8/ Excludes Massachusetts markets for purposes of comparison.

9/ Excludes Massachusetts markets except Fall River.

10/ Excludes Akron, Stark County, and Southwest Kansas.

11/ Milkfat shipped into marketing area as cream or half and half. Excludes storage cream for fluid use.

1/ Excludes producer-handlers who purchase no milk from other producers.

2/ Revised.

3/ Preliminary.
4/ Markets excluded: Appalachian, Black Hills, Southwest Kansas, and Central Mississippi.

Compiled by the Standardization and Program Development Branch, Dairy Division, from reports of Market Administrators.

(Continued from page 37)

In the Philadelphia, Pa. market, fluid cream sales in 1956 were unchanged from a year earlier. Among the 5 markets reporting increased sales, gains ranged from 1 to 9 percent. In the important New York City market, sales of fluid cream products in 1956 were 1.2 percent above the previous year.

Whole milk receipts continue to increase

Average daily receipts of milk from producers in 53 Federal Order markets in 1956 were 4.2 percent above 1955. This compares with an increase of 3.7 percent in 1955 over 1954 in the same markets. Increases were general, with all but four of these markets showing larger receipts in 1956 than in 1955. The four markets with lower receipts in 1956 were Springfield, Mass., Cleveland, Memphis, and Fort Smith, Ark. In the other 49 markets increases ranged from 1 percent in the Merrimack Valley, Mass. and Cincinnati, Ohio markets to 19 percent in the Cedar Rapids-Iowa City marketing area. Twenty of these markets showed increases of 10 percent or more.

During 1956, more than 173,000 producers shipped milk to the 53 Federal Order markets. This represented a drop of about 8,000 or 4.3 percent from the 1955 total and was 13,000 or 6.9 percent below the 1954 number. Thirteen markets showed a larger number of producers shipping in 1956 than in 1955.

Daily receipts per producer in the 53 markets averaged 468 pounds during 1956. This was 9.1 percent or 39 pounds above the 1955 average. Average daily shipments per producer during 1956 were larger than 1955 in all markets. Increases generally ranged from 3 to 19 percent with the exception of the Minneapolis-St. Paul market which showed a 33 percent increase. Of the 53 markets, 32 reported increases of 10 percent or more in receipts per producer.
